A car chase scene from the 1968 film Bullitt, directed by Michael Winner, starring Steve McQueen and co-starring a young Patrick Swayze, is being used as a backdrop for a race in an online racing game.The game is called Car Action and runs on the XBOX 360.Q: C# Generics and Type Parameters Lets say I have a generic Class with a type parameter T. public class GenericClass { ... } And in a separate assembly I have the following Interface: public interface ISomeInterface { ... } And a class that implements the interface, but with a new type, called 'RooData: public class RooData : ISomeInterface { ... } Now in a third assembly, I'm making a GenericClass of type 'RooData'. So I do: And I want to make a method that takes the GenericClass and converts it into a GenericClass. public static GenericClass convertToGenericClass(GenericClass) { ... } What I'm not sure about is what T should be in the generic class. I can't seem to find any documentation on how to do this. A: GenericClass means "a type which is a subclass of GenericClass", whereas GenericClass means "a type which is both a subclass of GenericClass and an instance of GenericClass". C# allows you to specify the type parameter for a generic type using either a parameter type declaration or a type parameter reference. In this case, what you want is: public static GenericClass convertToGenericClass(GenericClass x) { ... } You can then use it like this: GenericClass 82157476af
